Message from Director General of Health Services

It is with great pleasure that I send this message to the 12th edition of 'Cancer Incidence Data - Sri Lanka 2010' published by the National Cancer Control Programme of the Ministry of Health, Nutrition & Indigenous Medicine. An organized system for cancer registration commenced in 1985 in Sri Lanka with the establishment of the National Cancer Control Programme. Since the publication of the first report in 1990, twelve publications have been released on cancer incidence data up to now. I am happy to note that annual publications are recommenced from 2005.

Prevention & control of non-communicable diseases (NCD) is one of the priorities of global health agenda. World Health Organization (WHO) has identified health information as one of the major building block of health system strengthening for NCD control. Therefore the information on cancer incidence is extremely useful in planning, resource allocation, implementation and monitoring of activities related to cancer control at national and sub national level.

I would like to thank WHO country office and the International Agency for Research on Cancer (IARC) for providing technical support to further strengthen cancer registration in Sri Lanka. I highly appreciate the contributions of different stakeholders including the staff of oncology units, histopathology & haematology laboratories and Oro-Maxillo Facial (OMF) units in providing relevant data. The hard work of National Cancer Control Programme for the coordination of this activity is highly acknowledged.

Dr. Palitha Mahipala

Director General of Health Services

Message from Deputy Director General of Non Communicable Diseases

It is with great pleasure, I am sending this message to the 12th edition of 'Cancer Incidence Data - Sri Lanka 2010' published by the National Cancer Control Programme.

Cancer incidence data is one of the main outputs of the cancer surveillance system in the country. Strengthening cancer information and surveillance systems to monitor the progress and to evaluate the outcomes of cancer control actions is one of the seven policy objectives of the national policy and strategic framework on prevention and control of cancers in Sri Lanka which was launched in 2015. It is also one of the prioritised activities of the '*National Multi-sectoral Action Plan for the Prevention & Control of NonCommunicable Diseases of years 2016 – 2020*'.

I would like to appreciate the untiring efforts of Director and the staff of the National Cancer Control Programme and other stakeholders in expediting the process of cancer registration system in Sri Lanka to comply with the demand for latest information. I also hope policy planners, health administrators, health programme managers, clinicians and the researchers will utilize this information maximally for performing their duties at respective fields of work.

Dr. Champika Wickramasingha

Deputy Director General of Non Communicable Diseases

Forward

The process of continuing, systematic collection, storage, analysis, interpretation & dissemination of information on reportable malignancies is called the cancer surveillance / cancer registration system in the country. The human and physical resource organization for conducting the cancer surveillance is called the cancer registry. Publication of cancer incidence data is one of the key tasks of Sri Lanka Cancer Registry (SLCR) and this is the 12th edition of SLCR.

Over the years National Cancer Control Programme has taken several initiatives with the guidance of National Advisory Committee on Prevention & Control of Cancers to integrate cancer surveillance at cancer treatment centres and expedite the process of cancer surveillance with special emphasis to improve the timeliness & coverage of cancer incidence data.

The active participation of stakeholders including the Ministry of Health officials, staff of cancer treatment centres, histopathology, haematology and oral pathology laboratories, OMF units, professional colleges, academia, WHO country office and the International Agency for Research on Cancer (IARC) of WHO were immensely helpful in further strengthening of SLCR. The team work of deputy director and the staff of NCCP are sincerely appreciated as without their dedication and determination generating this kind of publication is impossible.

I hope this publication will be utilized maximally for programme planning, resource allocation, programme implementation, monitoring, evaluation and conducting cancer research. NCCP also appreciates the suggestions for improving future publications.

Dr Sudath Samaraweera

Director
National Cancer Control Programme

Executive summary

The 2010 publication of cancer incidence data of Sri Lanka is the 12th volume in the series of publications. This publication presents the cancer incidence data collected from 39 sources namely all nine cancer treatment centres in the country, 17 maxillo-facial surgery units, and 13 pathology laboratories. The increase in the number of cases from 2009 to 2010 was 75.

The crude incidence rate (CR) for all cancers was 82.1 per 100,000 population and the age standardised rate (ASR) was 87.3 per 100,000 population. The most common cancer among females was breast cancer with a CR of 23.1 and an ASR of 23.0. The male cancer with the highest incidence was cancer of the 'lip, oral cavity and pharynx' (CR=18.4 and ASR =20.7). The CR of both these cancers has increased by approximately 1 per 100,000 from the levels observed in 2009.

When the top ten cancers among males, females and both sexes were considered the first four positions had remained unchanged from the previous year. From the 5th to the 8th position there was a slight interchange in the positions. The notable feature was the site 'Unknown Primary Site' which had been the 10th most cancer in 2009 in females, has been replaced by lymphoma.

The cancer with the highest life time risk of developing among females was breast cancer which was one in 40 females. The highest life time risk observed for males was also one in 40 males for lip, oral cavity and pharyngeal cancers.

The percentage of microscopically confirmed cases was 95.9% out of which 84.5% had been diagnosed by histology of the primary site.

According to the published data of the Registrar General's Department, 6438 male deaths and 5398 female deaths have occurred due to neoplasms. Out of those 6371 male and 5349 female deaths were due to cancer. A gradual increase in the proportionate mortality ratio for neoplasms could be observed from 2001 to 2010 (7.1 in 2001 to 9.1 in 2010).

Different trends in incidence (ASR) could be observed from 1985 up to 2010 for different cancer sites. Among males, the ASR of 'lip, oral cavity and pharyngeal cancers' which had remained more or less static at 17-18 per 100,000 male population from 1985- 2000 and decreased in 2005 to 14.1, had again increased to 20.7 in 2010.

A gradual increase in the ASR was observed in cancers of the oesophagus, stomach, colon, hematopoietic system and 'trachea, bronchus and lung' in males. The ASR of cancers of prostate gland has increased (from 0.8 in 1985 to 4.4 in 2010) and cancers of the 'rectum, anal canal and anus' (from 0.7 in 1985 to 3.8 in 2010) by approximately 5 folds and bladder cancers from 0.9 in 1985 to 3.0 per 100,000 males in 2010. The observed increases could be partly due to increased detection and reporting to the registry as well as genuine increases in the incidence.

Similarly a gradual increase in incidence in female cancers could be seen in colon, 'rectum, anal canal and anus', stomach, 'trachea, bronchus and lung', hematopoietic system and skin. The ASR had remained more or less static in oral, laryngeal and bladder cancers in females. A substantial increase in the ASR was observed in breast cancers (from 9.4 in 1985 to 23.0 per 100,000 females in 2010) and cancers of the thyroid gland (from 1.7 in 1985 to 7.4 per 100,000 females in 2010). A marginal decreasing trend in the ASR was observed for uterine cervix cancers (from 10.4 in 1985 to 8.5 per 100,000 females in 2010).

Introduction

The National Cancer Control Programme which was established in 1980 made its first publication of cancer incidence data for the year 1985 in 1990. Thereafter publications were done annually for the years 1986 and 1987. Annual publication of data had stopped in 1987 due to logistic reasons and five-yearly publications had been done for the years 1990, 1995, 2000 and 2005. The annual publication of cancer incidence data was recommenced from 2006. Data collected only from the cancer treatment centres had been published till 2005. In the publications from 2006, data from oral and maxillo facial units and pathology labs have been incorporated.

Methodology

Cancer incidence data of 2010 represents data collected from all 9 (nine) cancer treatment centres in the country, 17 (seventeen) Oral & Maxillofacial Surgery Units and 13 (thirteen) Pathology laboratories of government hospitals. The data sources are given below.

Cancer Treatment Centres:

National Cancer Institute, Maharagama
Teaching Hospitals, Kandy, Karapitiya, Jaffna, Anuradapura and Batticaloa
Provincial General Hospitals Badulla, Kurunegala and Ratnapura

Oral & Maxillo- Facial Surgery Units in:

Dental Institute, Colombo
Teaching Hospitals, Anuradhapura, Colombo South, Kandy, Karapitiya and Ragama
Provincial General Hospital, Badulla
District General Hospitals, Chillaw, Gampaha, Kalutara, Matale, Matara, Polonnaruwa and Kegalle
Base Hospitals, Avissawella, Kuliyaipitiya and Panadura

Pathology Laboratories in:

National Hospital Sri Lanka
De Soysa Hospital for Women
Castle Street Hospital for Women
Lady Ridgeway Hospital
Faculty of Medicine, Karapitiya
National Eye Hospital
Faculty of Dental Sciences, Peradeniya
Teaching Hospitals, Colombo North, Kurunegala, and Welisara (Chest)
District General Hospitals, Kalutara and Gampaha
Base Hospital, Wathupitiwela

Most of the cancer incidence data were collected by pre-intern medical graduates who were specially trained in data extraction from the patients' clinic files and recording. This procedure was followed in all cancer treatment centres except in Jaffna where data were collected by the medical officers in the unit and directly sent to the registry and Batticaloa and Kurunegala cancer treatment centres where collection was done by registry staff of the National Cancer Control programme. Patients' clinic record files were used to extract relevant data for the cancer registry. In places where pre-intern medical graduates were used, data retrieval was done under close supervision by registry staff initially and later, a random sample was checked to improve reliability of data.

In addition to this active data collection, data from the Oral & Maxillofacial Surgery Units and the Pathology laboratories were collected passively using data collection formats supplied by the NCCP to these institutions.

Data quality checks were made during coding of data, while data entering to CanReg 5 software and at the basic analysis level. The clinic record numbers of all data sheets suspected with errors were noted and the relevant patient files were re-examined and necessary corrections were done to the data sheets.

The date of first histological or cytological confirmation or the date of confirmation by clinical investigation was taken as the date of incidence. In instances this information was not available; date of admission to the hospital due to the malignancy was taken as the incidence date.

International Classification of Disease for Oncology (ICDO-3) was used for topographical and morphological coding. This cleaned data was then fed to the computer using CanReg5 package by two data entry operators who had been trained by the registry staff. Due to the increased number of data capturing points in 2010, especially the pathology laboratories, duplicate searching was a laborious process. All multiple entries due to patients being registered in more than one treatment centre were identified and removed from the database using the duplicate searching mechanisms in the software by matching basic information of the patient, demographic variables, topography and morphology. In addition to the duplicate search facility of CanReg5, excel sheets were also utilised to identify duplicate entries which were not identified by the Canreg5 software due to minor changes in spelling of names, addresses etc.

Cases under behaviour code '3' (Malignant primary site) only were included in the analysis.

Mortality data were calculated for all neoplasms as the previous registries also had considered both malignant and non-malignant neoplasms together. This had been done to facilitate analysing the trend in mortality due to neoplasms.

In the analysis of trends in cancer incidence, 'Age Standardised Rates' were recalculated from the age specific incidence rates from 1985 to 2000 using the standard world population used for calculation of ASR from 2005 onwards.

CR: Crude rate per 100,000 population

ASR: Age standardized rate per 100,000 world population

The cumulative incidence rate given in Table 10 is a summary measure of the age specific incidence rates from 0-74 years. It is the summation of values of all the age specific incidence rates multiplied by 5 (as incidence rates were calculated for 5 year age groups) expressed per 100 persons in the population.

The life time risk of developing the leading cancers is also given in Table 10. The life time risk is given as a percentage, the risk of developing a particular cancer per 100 persons in the population as well as risk of developing a particular cancer given as number of persons per new case developed. One in every 10 males and one in every 11 females have a risk of developing cancer during their lifetime (0-74 years).

Table 10: Cumulative Incidence Rate (%) and Lifetime Risk (0-74 years) of leading cancer sites- 2010

Staging information of common cancers- 2010

Figures, 24, 25 and 26 give the staging information of the three main cancers namely, breast, cervical and oral cancers. Information on staging was available for 1380 (56.6%) of breast cancers, 469 (55.5%) of cervical cancers and 443 (16.7%) of oral cancers. The percentages computed are out of the cancers with staging information.

Appendix Statistical Terminology

Population at risk

It is the part of a population which is susceptible to develop a specific cancer. It is defined on the basis of demographic data, such as place of residence, sex, age group, etc. Years of risk duration are counted in person-years

Incidence

Incidence quantifies the number of new cases of disease that develop in a population of individuals at risk during a specified time interval. Usually it is given as per 100,000 population per year.

Mortality

It is usually expressed as a rate. It is a measure of the number of deaths (in general due to a specific cause) in a specific population, per unit time. Mortality rate is typically expressed in units of deaths per 1000 individuals per year.

Crude rate

Data on incidence or mortality are often presented as rates. For a specific tumour and population, a crude rate is calculated simply by dividing the number of new cancers or cancer deaths observed during a given time period by the corresponding number of person years in the population at risk. It is usually expressed as an annual rate per 100,000 persons at risk.

Crude incidence rate

= Total number of cases in the year/ Total midyear population at risk

Crude death rate

= Total number of deaths in the year/ Total midyear population at risk

Age-specific rate

The age-specific rate is calculated simply by dividing the number of new cancers or cancer deaths observed in a given age category during a given time period by the corresponding number of person years in the population at risk in the same age category and time period. The result is usually expressed as an annual rate per 100,000 person-years. In this publication, five-year age categories are used (highest group 75+).

Age –specific incidence rate

= Number of cases in the five-year age group/ population at risk in the corresponding age group

Age –specific death rate

= Number of deaths in the five-year age group/ population at risk in the corresponding age group

ASR (age-standardised rate)

Standardised rates are statistically constructed summary rates that account for the difference between populations. An age-standardised rate (ASR) is a summary measure of the rate that a population would have if it had a standard age structure. Standardisation is necessary when comparing several populations that differ with respect to age because age has such a powerful influence on the risk of cancer. The ASR is a weighted mean of the age-specific rates; the weights are taken from population distribution of the standard population. In this publication 'World Population' was taken as the standard population.
